ACID STORAGE

The New York City Fire Department (FDNY) has specific requirements regarding the storage of acids. The regulations require acids not be stored on bare metal surfaces nor in contact with flammable liquids. Also, Nitric Acid must be separated from other acids or bases.

The Department of Environmental Health and Safety recommends that acids be stored in a plastic tray and Nitric Acid be stored in a different location or in a separate tray. Acids and flammables may be stored in the same location if the acids are separated from the flammables by a plastic tray. Violation orders have been, and will continue to be issued if these regulations are not followed.
